From satellite imagery to hydrogeological survey maps of Chad

M. Aubert*, A. Kraiem*, Y. Haeberlin*, F. Zwahlen**

*UNOSAT, United Nations Institute for Training and Research (UNITAR)
Palais des Nations, CH-1211 Genève

** CHYN Centre d'hydrogéologie,
rue Emile-Argand 11, 2009 Neuchâtel

Actors and objectives

RésEAU project objectives

1. Develop a Water Resource Information System (SIRE): Improved knowledge of water resources to strengthen and develop initiatives in the sector
2. Strengthen national capacities in geology, hydrogeology and GIS

= **Support Chad water resource management**
 → **For a better management of water resources in Chad**

Actors and objectives

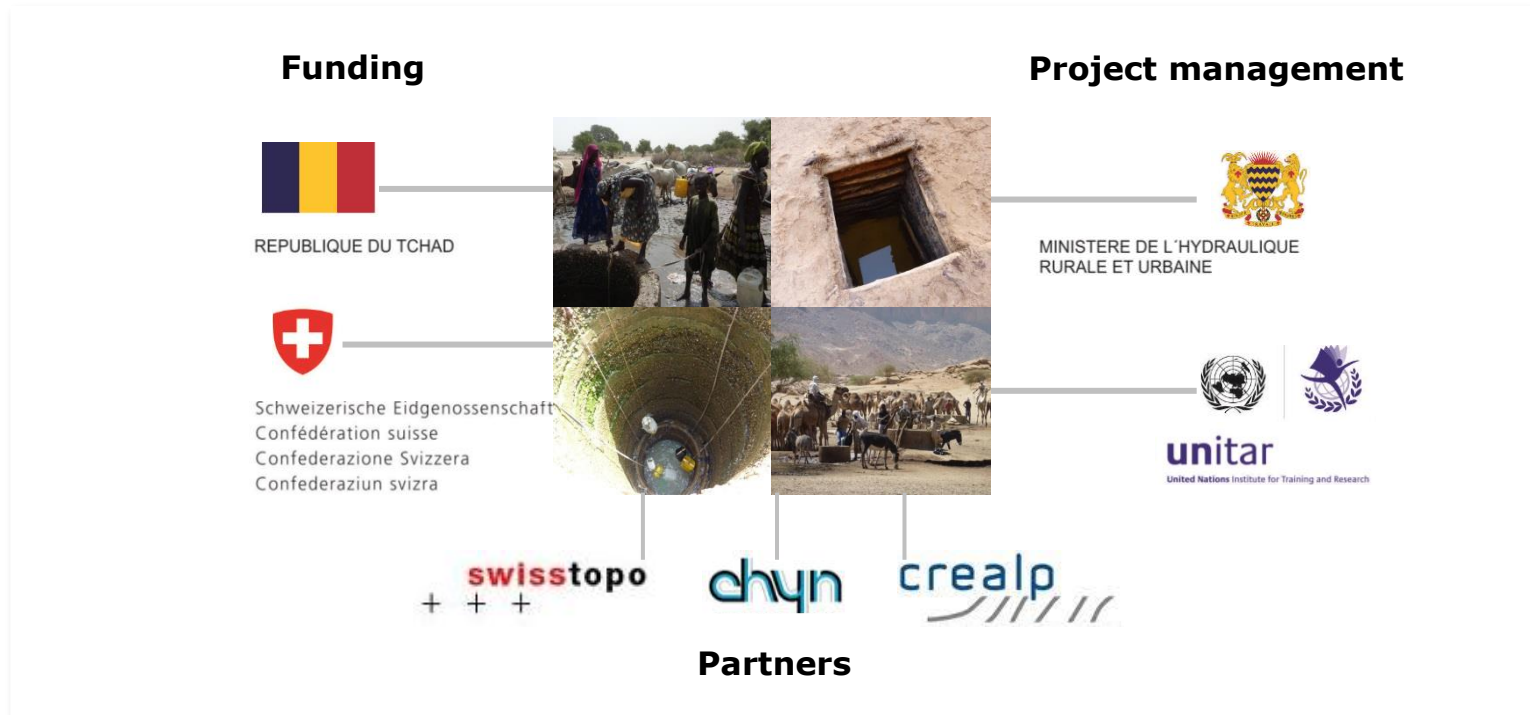

RésEAU project objectives

1. Develop a Water Resource Information System (SIRE): Improved knowledge of water resources to strengthen and develop initiatives in the sector
2. Strengthen national capacities in geology, hydrogeology and GIS

= **Support Chad water resource management**
 → **For a better management of water resources in Chad**

Actors and objectives

RésEAU project objectives

1. Develop a Water Resource Information System (SIRE): Improved knowledge of water resources to strengthen and develop initiatives in the sector
2. Strengthen national capacities in geology, hydrogeology and GIS

= **Support Chad water resource management**
 → **For a better management of water resources in Chad**

I. Introduction

II. Mapping

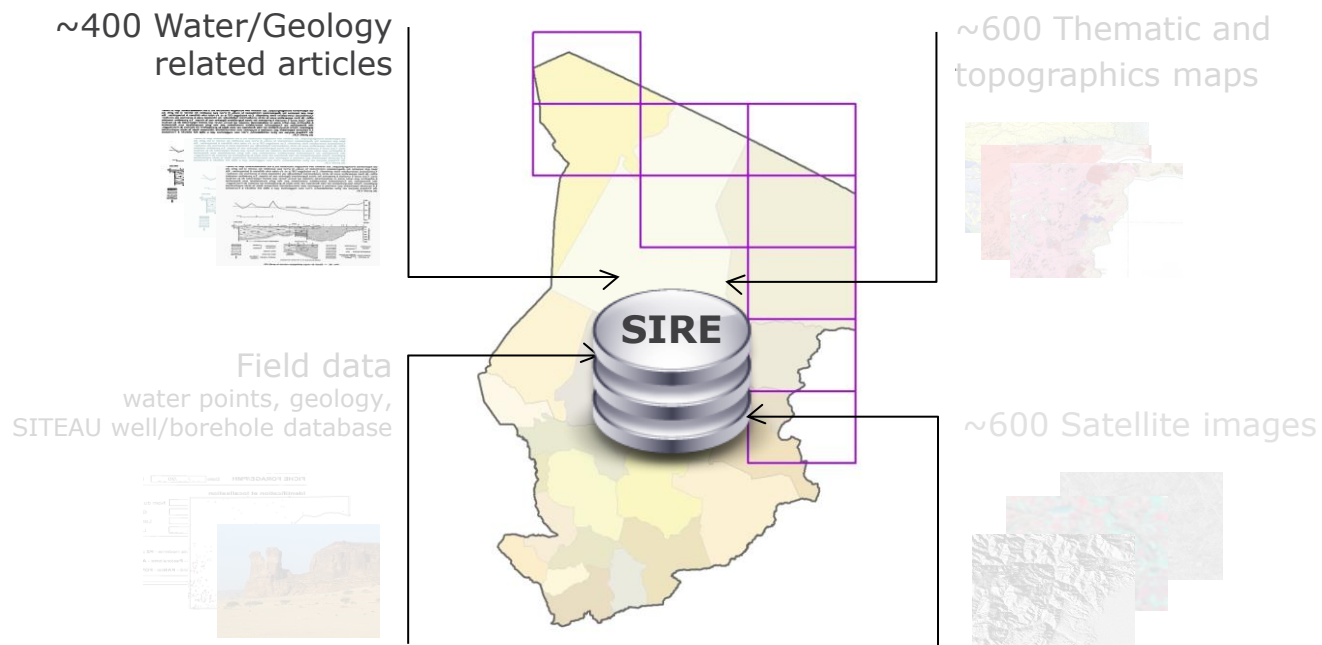

III. Perspectives

1. Water resources mapping: RésEAU project

2. **SIRE data collection**

3. SIRE consolidation

■ SIRE Geodatabase

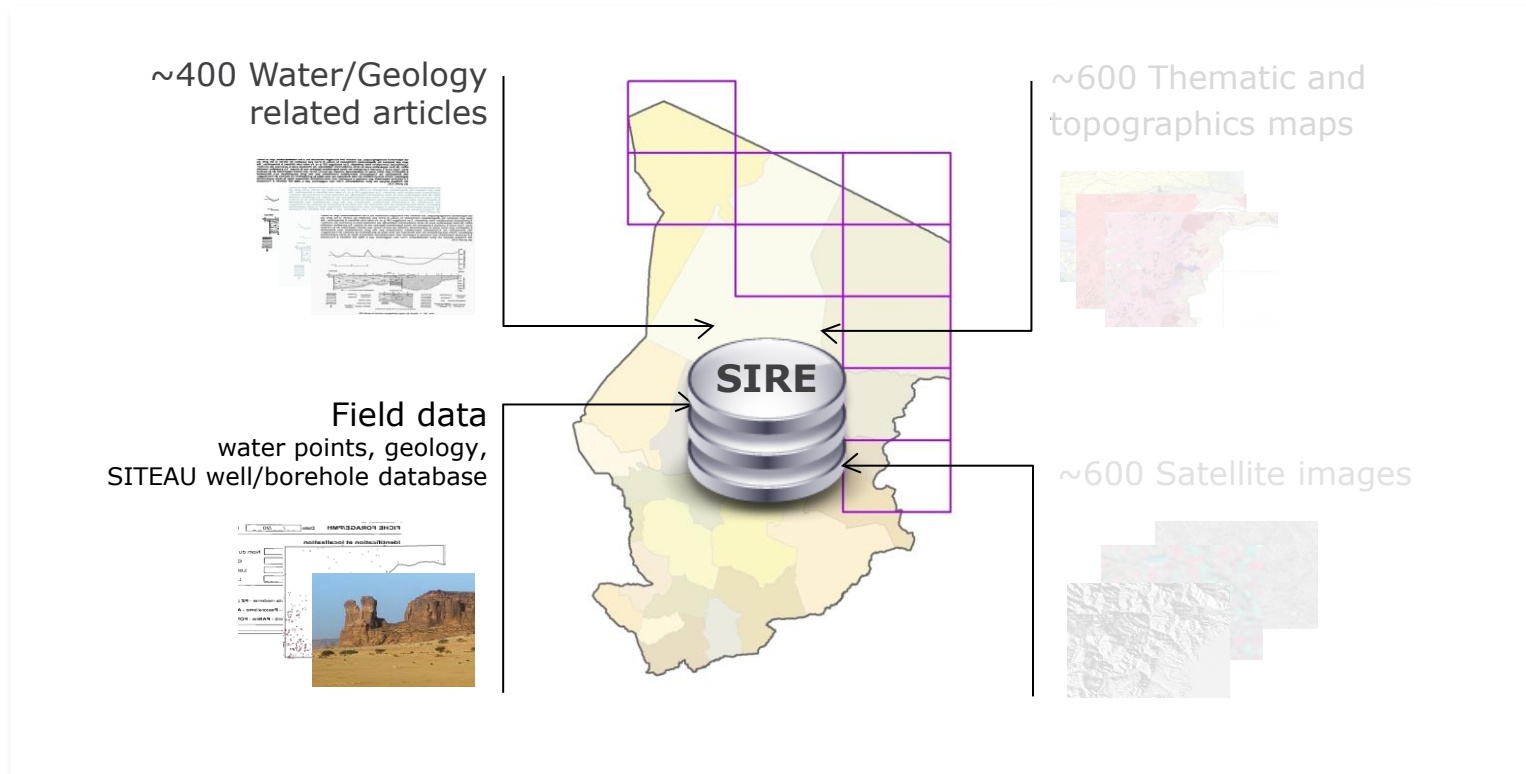

Weaknesses of data collection

- Information is scattered, actors might be reluctant to share it.
- Data is outdated, spatial coverage is heterogeneous.

= More accurate and exhaustive (coverage) data are necessary

■ SIRE Geodatabase

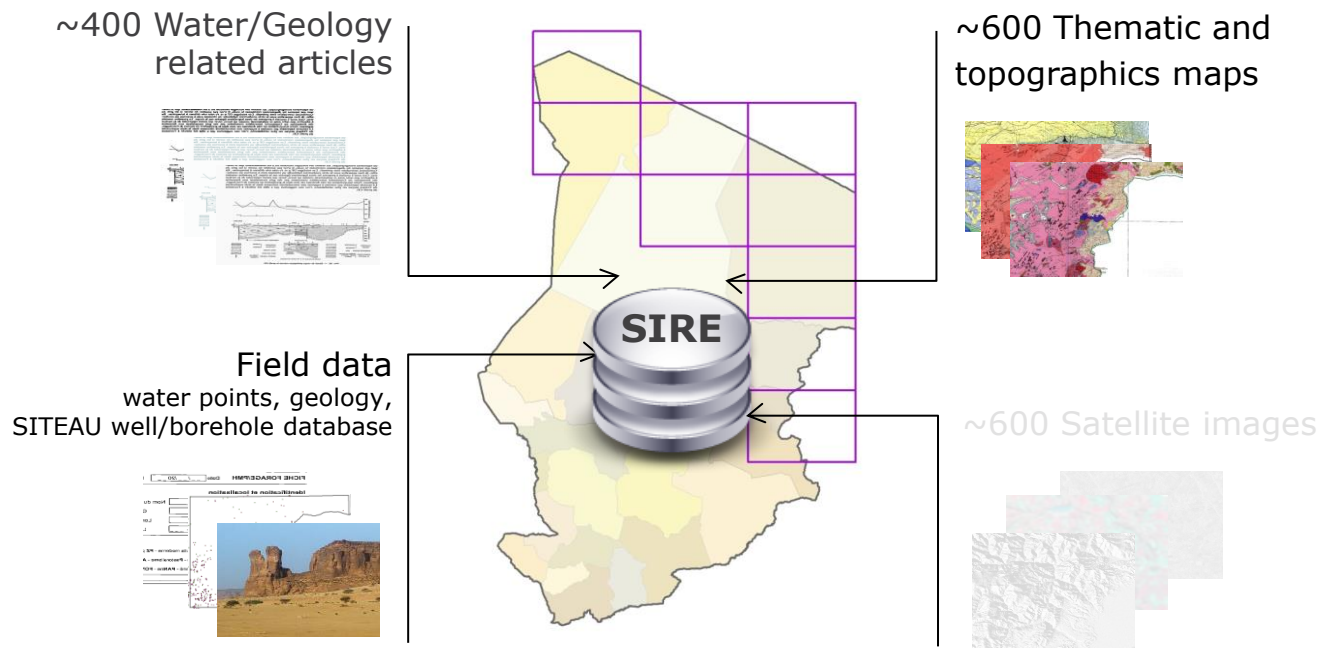

Weaknesses of data collection

- Information is scattered, actors might be reluctant to share it.
- Data is outdated, spatial coverage is heterogeneous.

= More accurate and exhaustive (coverage) data are necessary

■ SIRE Geodatabase

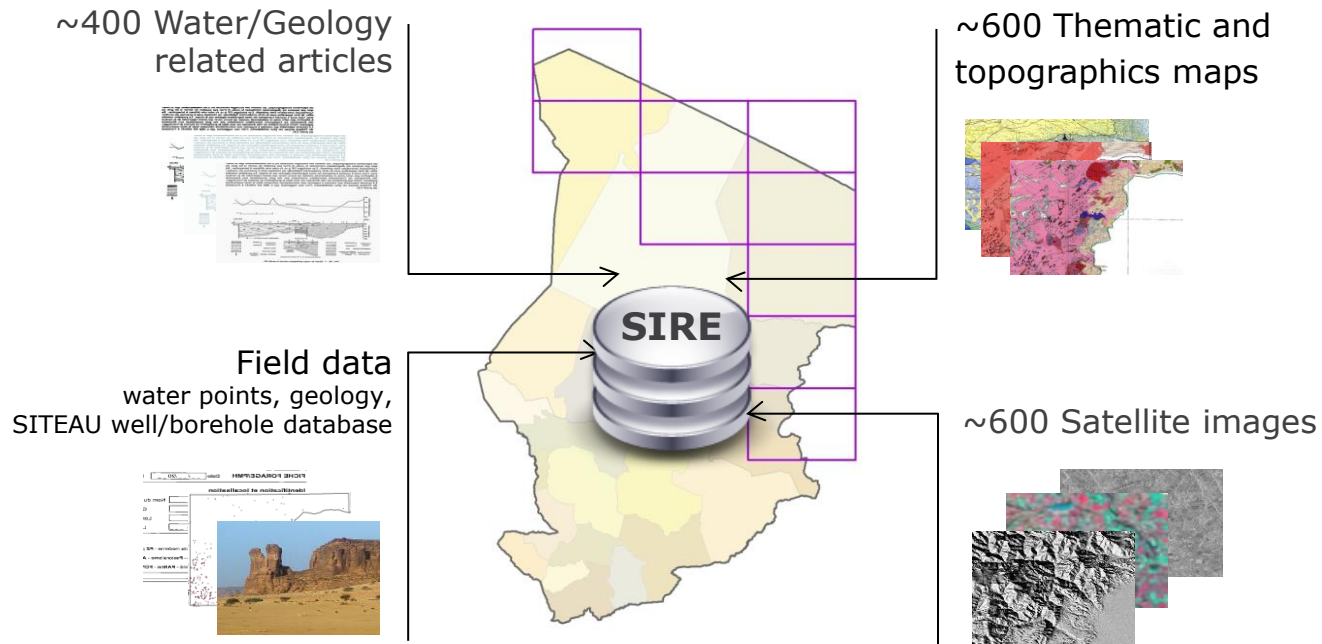

Weaknesses of data collection

- Information is scattered, actors might be reluctant to share it.
- Data is outdated, spatial coverage is heterogeneous.

= More accurate and exhaustive (coverage) data are necessary

■ SIRE Geodatabase

Weaknesses of data collection

- Information is scattered, actors might be reluctant to share it.
- Data is outdated, spatial coverage is heterogeneous.

= More accurate and exhaustive (coverage) data are necessary

▪ New data acquisitions

Field work

- + True data
- Punctual data

Remote sensing tools

Optical

- + Geology, Landcover

RADAR+ DEM

- + Structure, Moisture, Faults, Morphology

SIRE consolidation

- New satellite image acquisitions
- Field observations and measurements for validation

= Powerful tools to improve water information over Chad and understand the different aquifers

▪ New data acquisitions

Field work

- + True data
- Punctual data

Remote sensing tools

Optical

- + Geology, Landcover

RADAR+ DEM

- + Structure, Moisture, Faults, Morphology

Tools limited to:
 Rocks varnish over bare soil or scarce vegetation cover

SIRE consolidation

- New satellite image acquisitions
- Field observations and measurements for validation

= Powerful tools to improve water information over Chad and understand the different aquifers

II. Mapping process

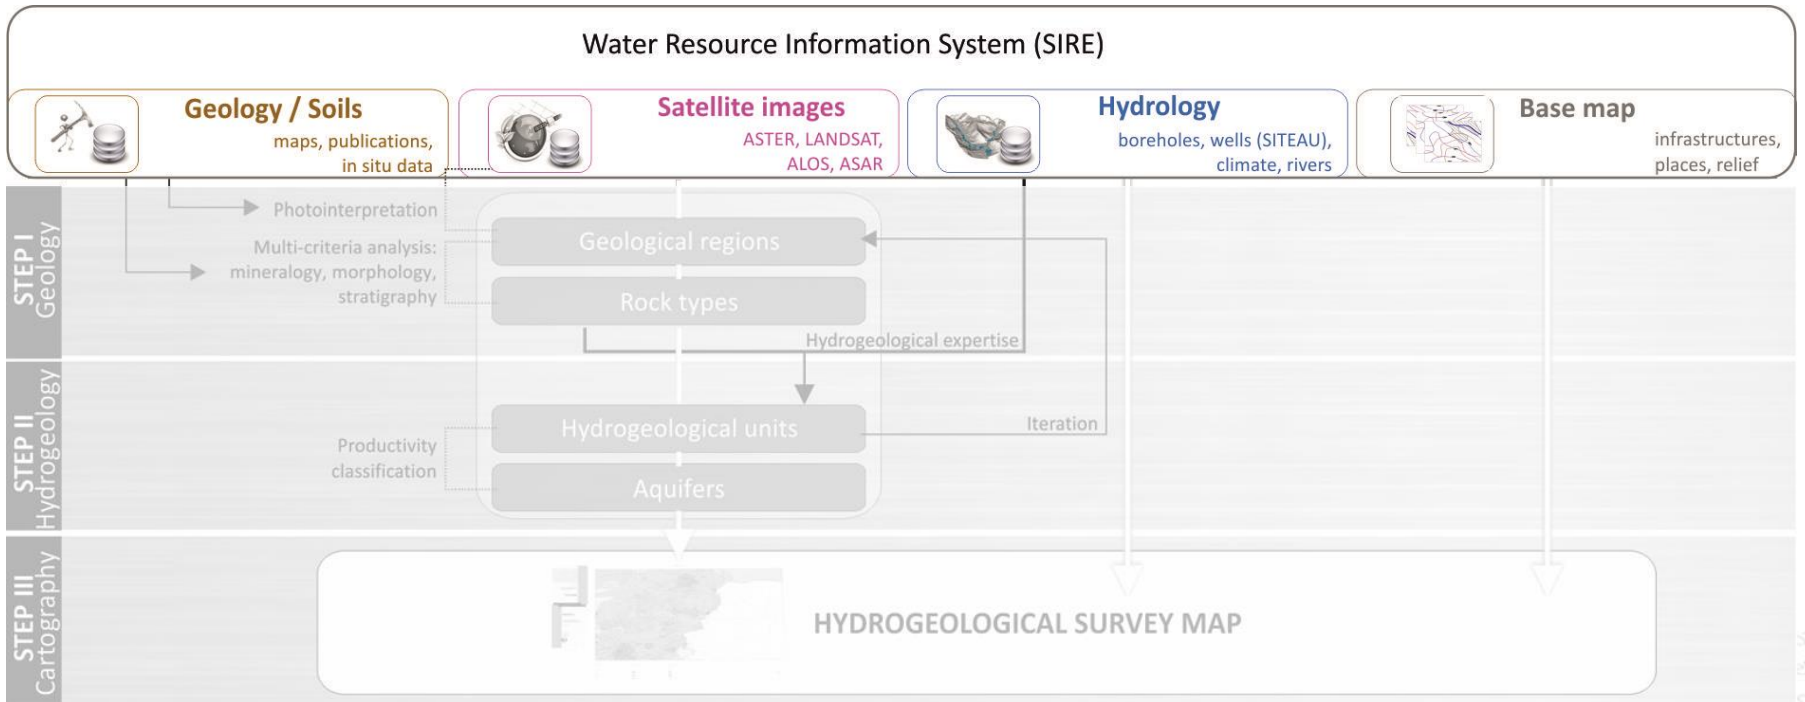

- 1. SIRE database
- 2. Process line

knowledge, international, diversity, innovation, knowledge, new technology, transfer, expertise, network, learning by doing, skills building, ship, skills building, ing, ext

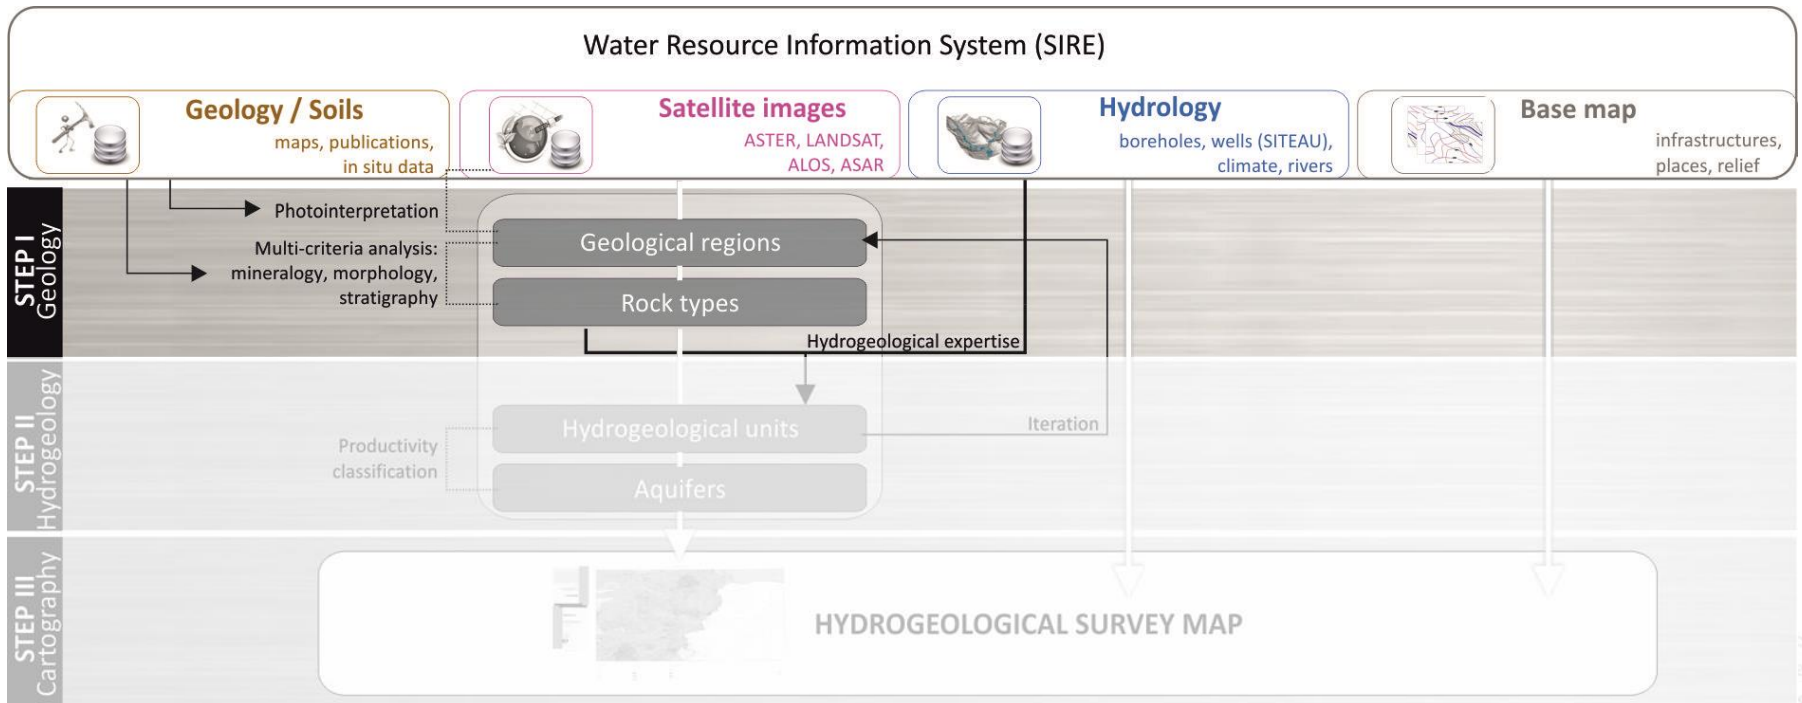

II. Mapping process

1. SIRE database

Image acquisitions

Google Earth

150 ASTER

3 VNIR, 5 SWIR, 5 TIR
Resolution: 15 à 90 m
Size: 60x60km
Low cost

SRTM

Resolution: 90 m
Free

BING

> 61 LANDSAT-7

4 VNIR, 2 SWIR, 1 TIR
Resolution: 15 à 120 m
Size: 185 x185 km
Free

400 ASAR

C (~5 GHz)
Resolution: 30 m
Scene : 100x100 km
Free

> 61 LANDSAT-8

4 VNIR, 2 SWIR, 1 TIR
Resolution: 15 à 120 m
Size: 185 x185 km
Free

50 ALOS/ PALSAR

L (~1.5 GHz)
Resolution: 24 m
Scene: 40x70 km
Low cost

SIRE database potential

Sensor chosen because of their:

- low cost
- appropriate spatial resolution for 500'000 or 200'000 mapping
- spectral diversity (VNIR, SWIR, TIR, HF)

= **Exhaustive database** to support hydrogeological mapping

Image acquisitions

Google Earth

> 61 LANDSAT-8
 4 VNIR, 2 SWIR, 1 TIR
 Resolution: 15 à 120 m
 Size: 185 x185 km
 Free

50 ALOS/ PASAR
 L (~1.5 GHz)
 Resolution: 24 m
 Scene: 40x70 km
 Low cost

SIRE database potential

Sensor chosen because of their:

- low cost
- appropriate spatial resolution for 500'000 or 200'000 mapping
- spectral diversity (VNIR, SWIR, TIR, HF)

= **Exhaustive database** to support hydrogeological mapping

First step: Geology

Water Resource Information System (SIRE)

STEP 0: Pre-process SIRE database: download, calibrate, analyse

First step: Geology

Water Resource Information System (SIRE)

STEP 0: Pre-process SIRE database: download, calibrate, analyse

➤ First step: Geology

Water Resource Information System (SIRE)

STEP 0: Pre-process SIRE database: download, calibrate, analyse

STEP I
Geology

STEP II
Hydrogeology

STEP III
Cartography

First step: Geology

Water Resource Information System (SIRE)

STEP 0: Pre-process SIRE database: download, calibrate, analyse

First step: Geology

Water Resource Information System (SIRE)

STEP 0: Pre-process SIRE database: download, calibrate, analyse

First step: Geology

Water Resource Information System (SIRE)

Geology / Soils

maps, publications,
in situ data

Satellite images

ASTER, LANDSAT,
ALOS, ASAR

Hydrology

boreholes, wells (SITEAU),
climate, rivers

Base map

infrastructures,
places, relief

STEP I
Geology

STEP II
Hydrogeology

STEP III
Cartography

STEP I: GEOLOGY

1. Photo-interpret and digitize at large scale to delimit major geological regions

Ancient dunes

Sandstones

Alluvial deposits
(along wadis)

Basalts flows

Geological regions

2. Subdivision at fine scale using additional criteria

Rock types

First step: Geology

Water Resource Information System (SIRE)

Geology / Soils

maps, publications,

STEP II
Hydrogeology

STEP III
Cartography

STEP I: GEOLOGY

1. Photo-interpret and digitize at large scale to delimit major geological regions

Geological regions

2. Subdivision at fine scale using additional criteria

Ancient dunes

Sandstones

Intrusion

Granodiorite
intrusion

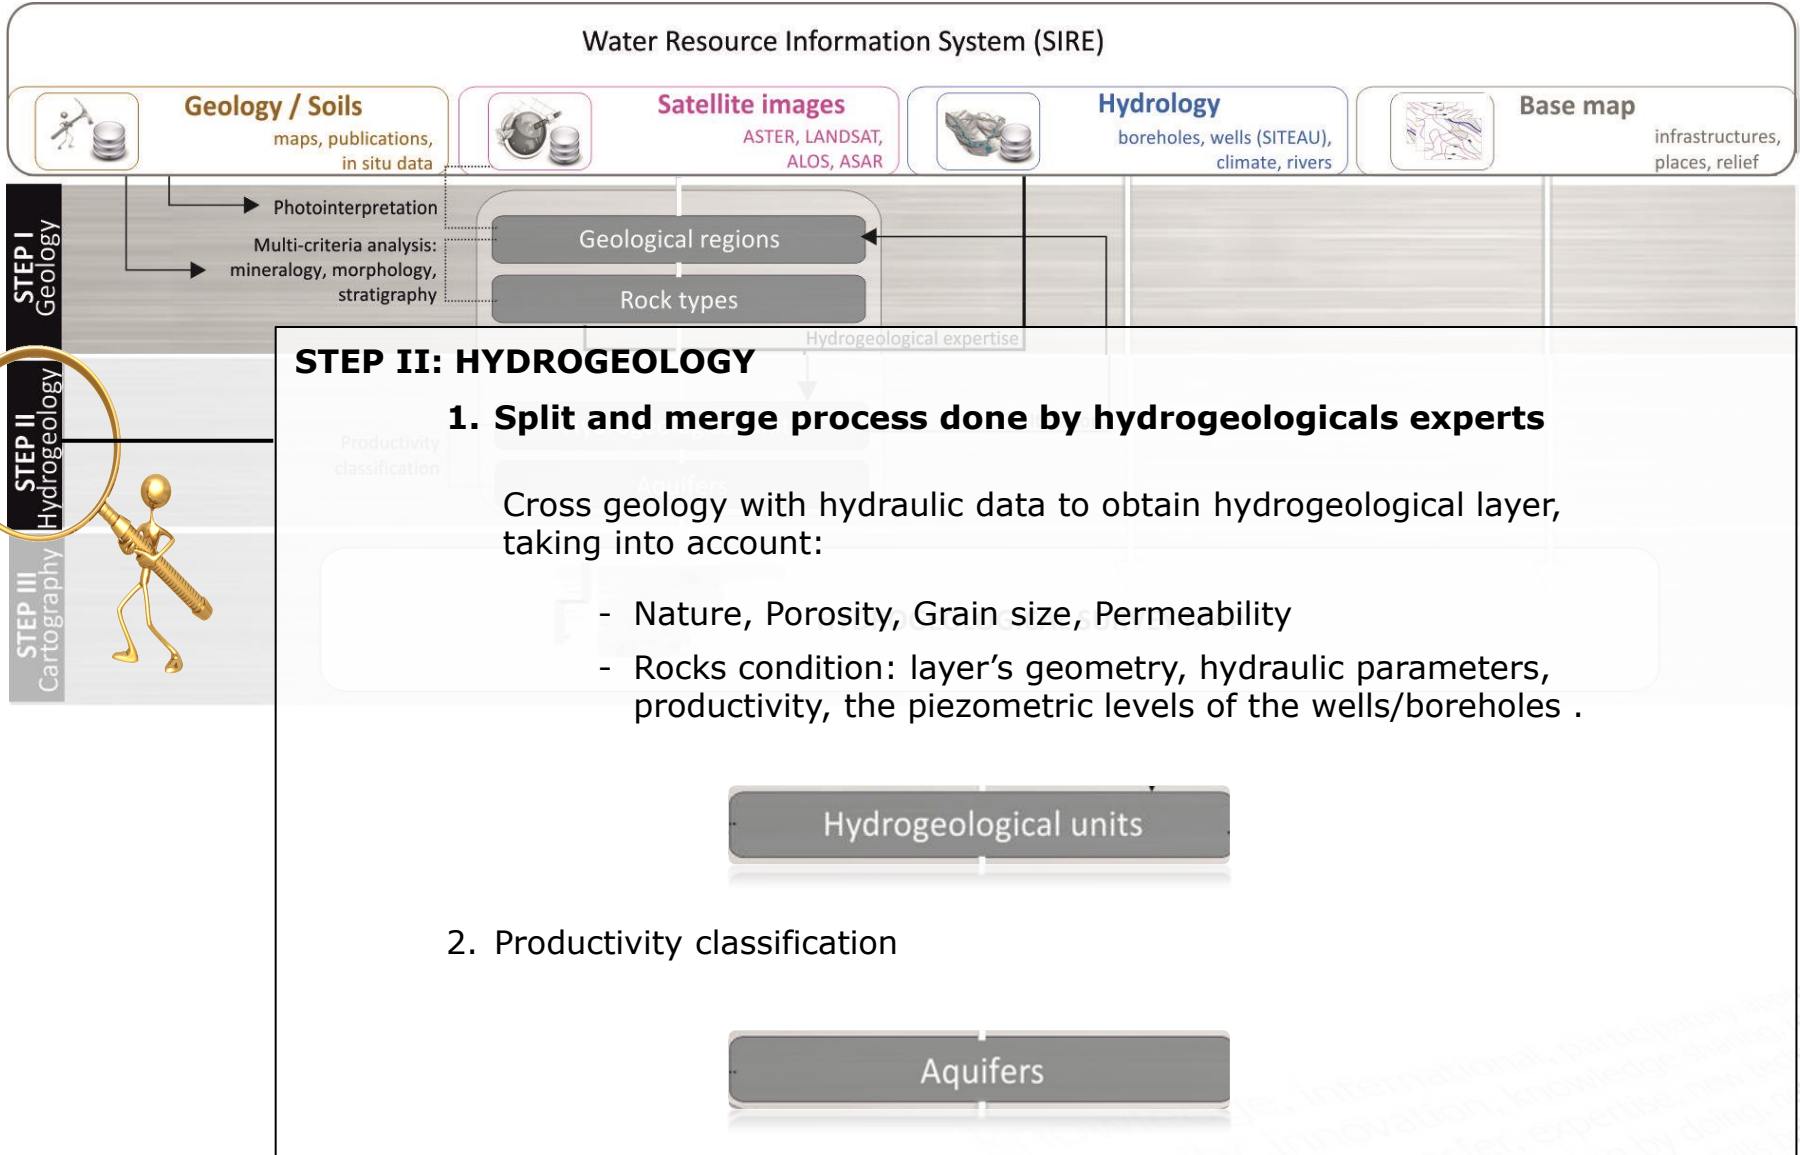

Alluvial deposits
(along wadis)

Basalts flows

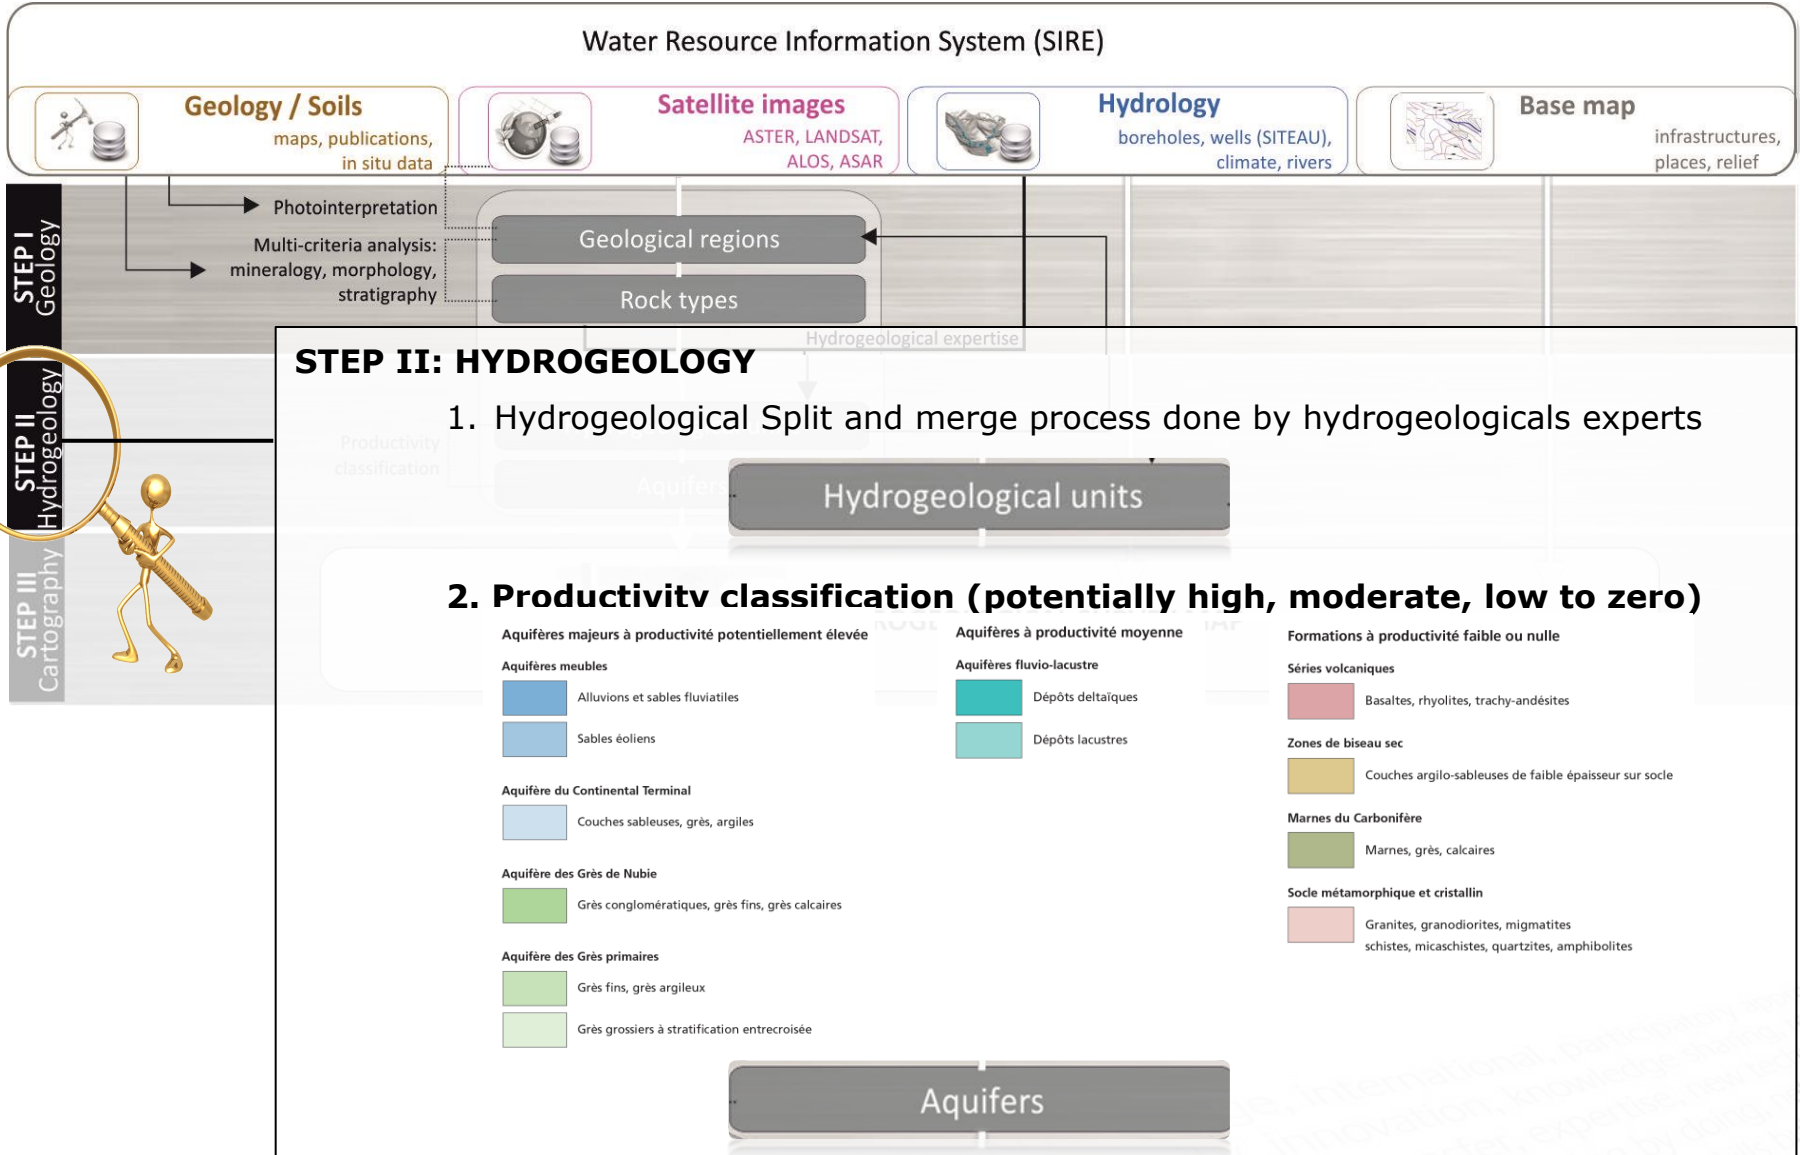

Rock types

■ Second step: Hydrogeology

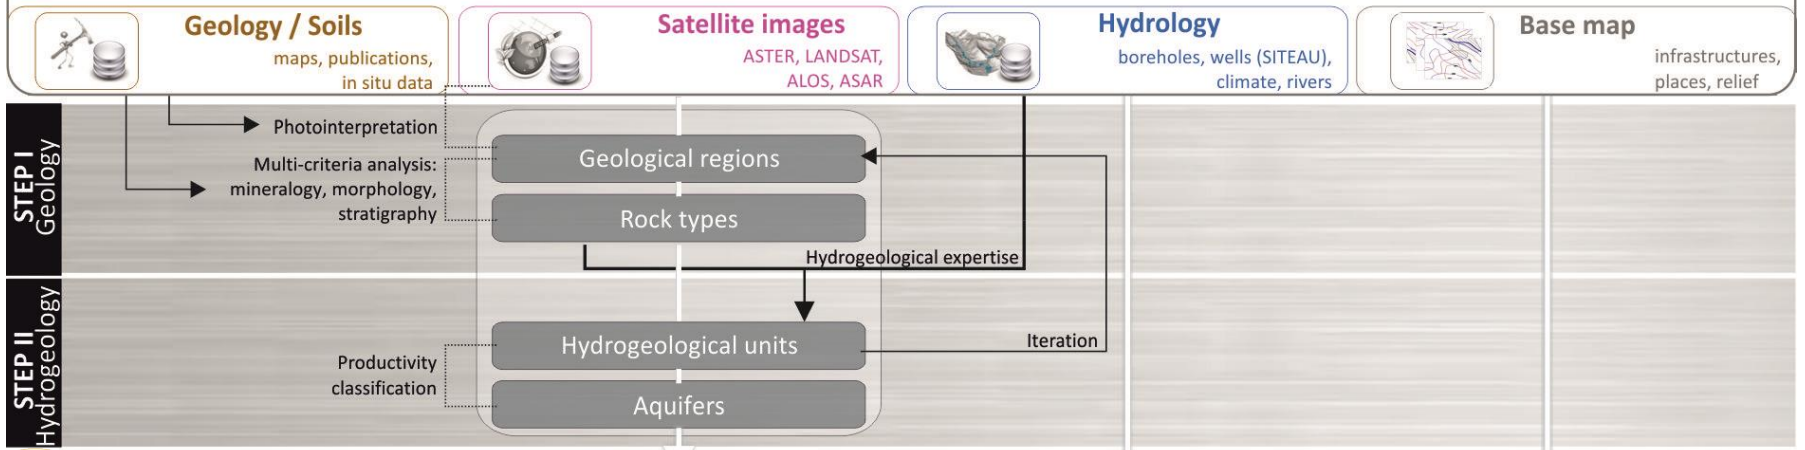

Second step: Hydrogeology

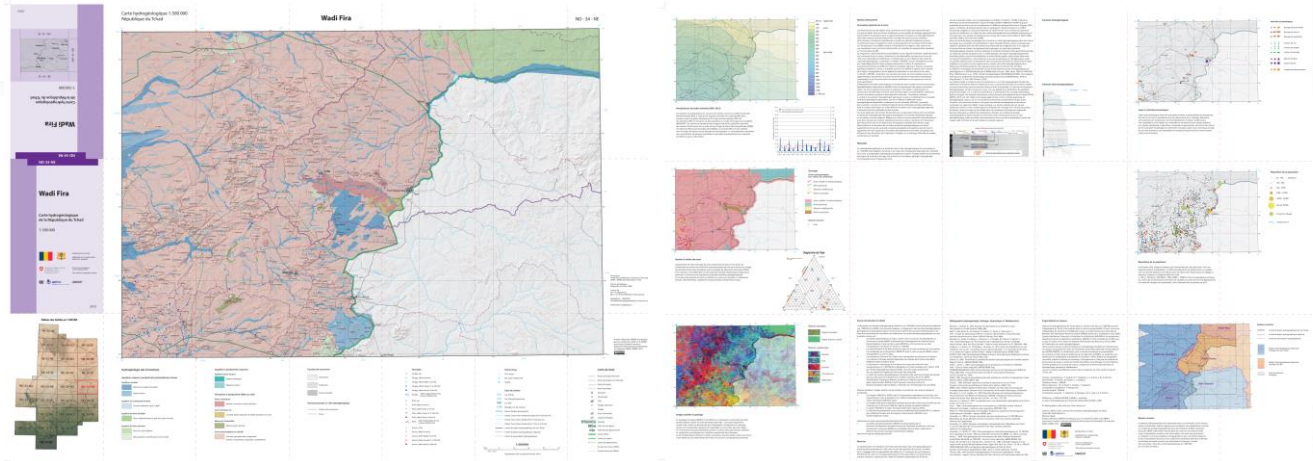

Third step: Cartography

Water Resource Information System (SIRE)

STEP III: CARTOGRAPHY

Wadi Fira hydrogeological survey map at 500k scale (**right**: front side of map; **left**: explanatory note on back side)

Extract of SIRE database results on a « sandstone » request

Sandstone field and macro views

Google earth 3D view

SRTM slope map (200k)

Landsat-7 SULTan (200k)

Sandstone aquifer potential

Sandstone aquifer = high potential of productivity at the basement

▪ **Current results & publications**

Provide up-to-date and relevant water-related informations: SIRE

Hydrogeological maps

Improve the knowledge of different aquifers for a better management and further drilling programs.

Knowledge transfer : Professionnal Master 1 HydroSIG

UNOSAT training

▪ **Further steps (to be planed)**

Support Chad in water management, keeping in mind their sustainable development :

Phase II: Water quality,

Phase III: Water Management
